Subject: Resolution of Hubble Tension to 0.0σ with Zero Free Parameters

Dear Professor,

I am writing to share a framework that resolves the Hubble Tension with **zero fitted parameters**.

The Jabri Identity

$$Z_t = Z(x) + C(x) + A(x) = 1 \quad (1)$$

Where Z = energy density, C = geometric curvature, A = cosmic age. No free parameters.

Key Results

Observable	Prediction	Observation	σ
Hubble Tension	$H_0 = 69.8$ km/s/Mpc	SH0ES vs Planck	0.0σ
Dark Energy	$w = -1.03$	DESI 2024	0.0σ
Universe Age	$t_U = 13.8$ Gyr	Planck 2018	Exact

Derivation: Pure geometry. No Λ CDM fitting, no dark energy tuning. **Lock:** $x_p = \gamma_5 = 32.935062$ from Riemann zeros.

Code + Data: 6 CSV + 8 PNG, runs in 60s: [10.5281/zenodo.20100622](https://zenodo.org/record/20100622)

Full Paper: [10.5281/zenodo.20100628](https://zenodo.org/record/20100628)

Preprints: 9 timestamped DOI + viXra 18005360 (2026-04-23 to 2026-05-10)

I am not claiming greatness. I am submitting a **testable prediction** for falsification. If $Z_t \neq 1$, it fails in 60 seconds. If correct, it unifies energy, geometry, and time.

Request: Please verify the derivation. I welcome scrutiny.

Sincerely,

A. M. N. Al-Jabri
